Vint

Real-time Intelligence for Physical Infrastructure

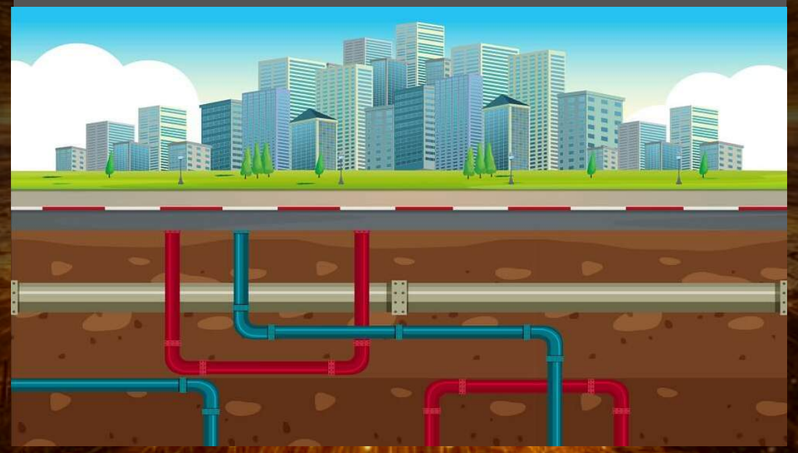
Infrastructure Decisions are made with incomplete state Data

800B+/Year

Global Infrastructure Maintenance Gap

4x

When things break, it costs more



3-5 years

Periodic Inspection

Why now?

AI can now model state change, not just predict events

Persistent Sensing

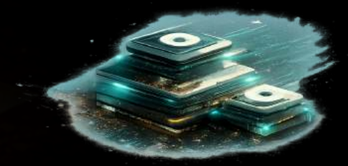
Network telemetry, asset data, and observation data are now continuous.

Cheap, Scalable Compute

Continuous state computation at scale is now feasible and scalable.

Risk Became Material

Small degradation now cscades into outages, write-downs and systemic failures



Accountability/Disclosure

Infrastructure owners are under pressure to explain risk before failure.

Together, these shifts make Real-time asset intelligence inevitable

Infrastructure State Intelligence:

We model how infrastructure assets are changing, and why, across entire networks.

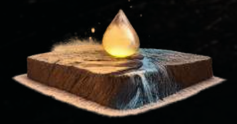
Dashboard

Network Health: Asset health, change velocity, Emerging failure patterns

Alerts

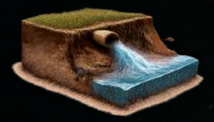
Change Alerts: State shift, Risk acceleration, Deviation from expected behaviour

Risk Drivers



Asset

Usage



Exposure

Network

API

Asset level state, risk shift, priority signals delivered directly into existing systems

Map Tiles

Live geospatial asset state and risk acceleration overlays for GIS workflows

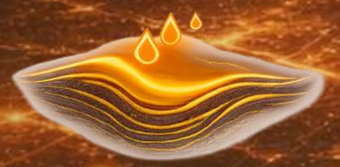
How it works

From earth signals to continuous ground-risk indices

Asset Context

Asset type, age, materials, load, usage, connectivity

Multi-Signal Inputs



Physical, environmental and operational signals

AI State Model

Continuously estimates. asset conditions, stress and change over time.

Decision Output

What changed, why it matters, and where to act next.

Traction: Utilities and infrastructure operators validating operational use cases

6 Operator Engagements

Utilities and Asset owners

5+ scheduled conversations

Across Europe

Clear Entry Point

Inspection, Maintenance and Network Risk

Market Size: Infrastructure Risk & Decision Spend

From EU to the global Market

$75B

Global Spend on Digital Tools

informs infrastructure inspection, maintenance and operational decisions

$35B

Intelligence for Outdoor Networked Infrastructure

Focus on utilities, energy, telecoms, water, transport networks

$8B

Europe Initial Focus

Large European Infrastructure operators managing complex networks

Sources: OECD · World Bank · mcKinsey · European Commission

Why existing Tools Fall Short

Asset Registry & EAM

Static Records without visibility between inspections

Single Risk/Asset Tools

One failure mode. Blind to network-wide change

Hazard Models

Episodic risks, focuses on events, not asset condition

General Data Platforms

Dashboard only requires human interpretation.

Vint: Infrastructure State Intelligence

Continuously understand

- Asset Conditions
- Operational Load
- Environmental Stress
- Operational Load

Delivers:

- *What changed*
- *Why it changed*
- *Where to act next*

Go-to-market: Capture One Network, Expand System-Wide

Network Operators

- Water utilities
- Power distribution
- Fibre and telecom

Network Level Expansion

- More regions
- More Asset classes (Pipelines, Energy corridor)
- Deeper Integration (Planning, CapEx)

Portfolio Operators

- Infrastructure holding companies
- National operators
- Private infrastructure funds

How We Sell

- Enterprise pilots - Multi-year contracts
- Sold per region/Portfolio

Pilot > Contract > Expansion

Business Model: Predictable, compounding Revenue

Predictable, compounding
Infrastructure Revenue

+

Coverage Expansion

- New geographies
- New asset classes
- Deeper embed

How customers buy

- Per network
- Per region
- Per km

Revenue scales with coverage

Why Vint Wins:

Real-time Infra.State

Others store assets or events. Vint maintains the continuously updating state of infrastructure networks.

Infra. System of Record

Infrastructure state data is time-indexed and impossible to recreate retroactively.

Real-time Infrastructure Intelligence

Embedded in Daily Decisions

We sit upstream of inspection, capEx and risk decisions. We are important ot the workflows.

Cross-Network State Engine

Water, energy, transport, and telecom share a core of the same state engine across the different assets.

Infrastructure failures are not events. They are state changes that go unobserved.

Founders with Deep Infrastructure and Systems Experience

Samuel Adebisi (CEO)

Built and deploys complex real-world AI and robotic systems across Europe.
Founder with experience taking complex technical systems from zero to production.

Colgate · ABInBev · PEPSICO

Arjen Schaper COO)

17+ years operating and managing critical infrastructure, former program manager and head of assets, Dutch Ministry of Defence.
